WOOFER G1
10G1 / 10G1PE**

Guitar Woofer, 10" designed to attend the need for all manufacturers of amplifiers and musicians. And to became evident the speaker performance in the high-end sound, is Selenium puts all his knowledge allied the best materials and process, to provide a quality product and reliability.

The cone light, made from long fibre, provides for all mobile great stability, high efficiency and good distortion.

The voice coil is made with wire resistant to high temperatures and has a body of Kapton®.

The basket made of reinforced steeel sheet and epoxi paint, gives to the woofer vast structure and mechanical strength.

The dust cap of fabric ensures a perfect dissipation of heat from voice coil.

The use of high-strength adhesive provide optimum sizing and durability.

HOW TO CHOOSE THE RIGHT AMPLIFIER

The power amplifier must be able to supply twice the RMS driver power. This 3 dB headroom is necessary to handle the peaks that are common to musical programs. When the amplifier clips those peaks, high distortion arises and this may damage the transducer due to excessive heat. The use of compressors is a good practice to reduce music dynamics to safe levels.

FINDING VOICE COIL TEMPERATURE

It is very important to avoid maximum voice coil temperature. Since moving coil resistance (R_E) varies with temperature according to a well known law, we can calculate the temperature inside the voice coil by measuring the voice coil DC resistance:

$$T_B = T_A + \left(\frac{R_B}{R_A} - 1 \right)\left(T_A - 25 + \frac{1}{\alpha_{25}} \right)$$

T_A , T_B= voice coil temperatures in °C.
R_A , R_B= voice coil resistances at temperatures T_A and T_B, respectively.
α_{25}= voice coil wire temperature coefficient at 25 °C.

POWER COMPRESSION

Voice coil resistance rises with temperature, which leads to efficiency reduction. Therefore, if after doubling the applied electric power to the driver we get a 2 dB rise in SPL instead of the expected 3 dB, we can say that power compression equals 1 dB. An efficient cooling system to dissipate voice coil heat is very important to reduce power compression.

NON-LINEAR VOICE COIL PARAMETERS

Due to its close coupling with the magnetic assembly, the voice coil in electrodynamic loudspeakers is a very non-linear circuit. Using the non-linear modeling parameters Krm, Kxm, Erm and Exm from an empirical model, we can calculate voice coil impedance with good accuracy.
